Organize your image files according to the following categories: **Picture files:** Now that you've started the image-editing process, you need to save your work so you can get back to it later. I'm going to start with a simple image, and so I saved it as a PSD file. You could also save as a TIF (using the Save As PSD command) or JPG file, or as a layered file that you'd use to open the image for editing (and save back to a PSD). **Watermark or copyright information:** Using the Image → Properties command, you can embed any copyright or watermark information you want into an image. In the following image, I inserted the words "©" and "Copyright," along with the copyright symbol. I also changed the fill color to a bright yellow to make the copyright text more prominent. **Background and Foreground:** After adding my background and foreground (in the previous task), I made a color fill for each layer by using either the Paint Bucket (for the bottom layer) or the Lasso tool (for the top layer). **Text:** I added text by using the Type tool to select and place the text or simply by typing it into the text box. For this image, I added copyright and product name. **Crop:** I cropped a portion of this image by using the Lasso tool and selecting the area I wanted to include in the final image. **Effects:** My last step was to add a basic gradient effect on the paper bag. If you'd like to, you can play around with the presets until you're happy with how your image looks. **Cleaning up your image:** Now it's time to clean up any errors or glitches you may have made. Use the Selection tool (not the Magic Wand) to select anything you don't want in the image. Once you're done with this task, go to the Layers panel and merge all of your layers into one. Now you're ready to save your file. Photoshop's Save command enables you to save the file in the TIF, PSD, or JPEG formats. # PICTURE FILE TRANSFER You may find it helpful to use Photoshop as your primary image editing software on your computer for the following reasons: **Heavy layers:** Photoshop's support of heavy layer editing makes it a

[Morphology of the esophageal epithelium]. The mucosa of the esophagus presents structural and functional characteristics of great importance to the digestion process. This mucosa is characterized by having an epithelial layer of three cell types: goblet cells, ciliated cells and a basal layer with no specific differentiation. The mucosa has a high transcellular and a moderate paracellular permeability which makes it susceptible to continuous exposure to noxious agents in the reflux of stomach contents. The esophageal mucosa must be able to endure continuous exposure to substances which potentially damage it. This requires the synthesis of a mucus barrier as well as a physical barrier consisting of a covering at the epithelial surface which limits epithelial exposure to the outside environment. The esophageal epithelium is covered by a peristomium, whose extension varies from the proximal to the distal part of the esophagus. The mucosa of the proximal region is characterized by a predominance of squamous epithelial cells with granular cytoplasm and a well-defined peristomium. The granular cytoplasm could explain the high squamous epithelium renewal potential because of the high activity of the mitochondria and the pro-apoptotic factors activated by p53. In the mid portion, the ciliated epithelium predominates, possibly due to the stenosis caused by the presence of the lower esophageal sphincter. Finally, the distal esophagus presents a mix of squamous and columnar epithelial cells with the covering peristomium reduced.
